

Frequently Asked Questions

Is it safe for my pet to receive multiple vaccines at once?

In most cases, it is safe for pets to receive multiple vaccines at once. However, vaccines may be spread out in smaller animals. Ask your veterinarian what is best for your pet.

There is a lump located at the injection site. Is this normal?

It is very common for your pet to develop a lump in the same location as an injection site. We often see it associated with the Rabies vaccine. The lump will go away with some time. You can do warm compresses at home to help the body break it down.

Do I need to look out for vaccine reactions?

Vaccine reactions are rare but they can happen. Most common side effects associated with vaccines are soreness at the injection site and lethargy. However, if your pet experiences vomiting, diarrhea, facial swelling, hives or any other concerning signs please contact us or your nearest 24hr veterinary facility as this is an emergency.

When can my puppy start socializing with other dogs?

It is recommended to delay socializing until your puppy has received their full Da2pp (canine distemper) series. Your pet may socialize with animals who are fully vaccinated

How often can I give my pet a bath?

You can bathe your pet once a month. Bathing more frequently can cause dry skin. If your pet does require a second bath, try to wash them with just water.

How old does my pet need to be to start Heartworm and Flea/Tick prevention?

Heartworm and Flea/Tick prevention can be started at 8 weeks of age as long as your pet weighs over 4lb.

Does my pet really have to be on Flea/Tick and Heartworm prevention year round?

With Heartworm Disease and Lyme cases on the rise, it is highly recommended for dogs to be on not only Heartworm Prevention, but also Flea/Tick prevention every month, year round, for life. Heartworm Disease is spread by mosquitoes and with more animals being brought up from the south, Heartworm Disease is becoming more prevalent in our area. In addition, with recent winters being milder, temperatures are frequently rising above 40 degrees fahrenheit increasing the prevalence of ticks and other external parasites.

Frequently Asked Questions

At what age can my pet get spayed/neutered?

Opinion varies between veterinarians. Speak with your veterinarian to decide what is best for your pet.

Does my pet have to get spayed/neutered?

It is highly recommended to get your pet spayed/neutered. Ultimately, as the pet parent, it is your decision whether or not you get your pet altered. But, it is our job to educate you on the risks of keeping your pet intact. There are health benefits that come with removing the reproductive organs such as reducing the chances of your pet developing reproductive cancers and other diseases.

Having an intact female increases the risk of:

Breast Cancer

Uterine Cancer

Pyometra (infection of the uterus) which is life threatening and requires emergency surgery

Unwanted pregnancy

Having an intact male increases the risk of:

Testicular Cancer

Prostatitis (infection of the prostate) and Prostate Disease

Certain urinary crystals that lead to bladder stones

Urinary problems/markings/spraying

I want to get my pet spayed/neutered but I have financial concerns, what can I do?

CareCredit, a medical credit card accepted at veterinary facilities and some medical facilities, is always an option when it comes to paying for veterinary care. If you are interested in applying for CareCredit, there is a direct link to the application on our website www.meridenanimalhospital.com. You also have the option to look into low cost spay/neuter clinics such as:

Nutmeg Clinic

626 Surf Ave, Stratford, CT 06615

203-690-1550

POA Spay

144 Main St unit e, East Hartford, CT 06118

860-206-7922

TEAM (Tait's Every Animal Matters) Van (cat's only)

1201 Boston Post Rd, Westbrook, CT 06498

860-399-5569

APCP- CT Spay/Neuter Voucher Assistance

Visit www.ct.gov and search APCP (Animal Population Control Program) for more information

Vaccine Schedule and information: Canine

8 weeks:

Da2pp (canine distemper)

Da2pp is a core vaccine meaning, regardless of lifestyle, all dogs should be vaccinated. This vaccine is boosted every 3-4 weeks up until 16 weeks of age.

Most dogs will receive 3-4 doses of Da2pp.

What does Da2pp protect against?

Da2pp is a combination vaccine that protects dogs from 4 different viral infections they can spread to each other. These infections are:

Distemper

Adenovirus 2

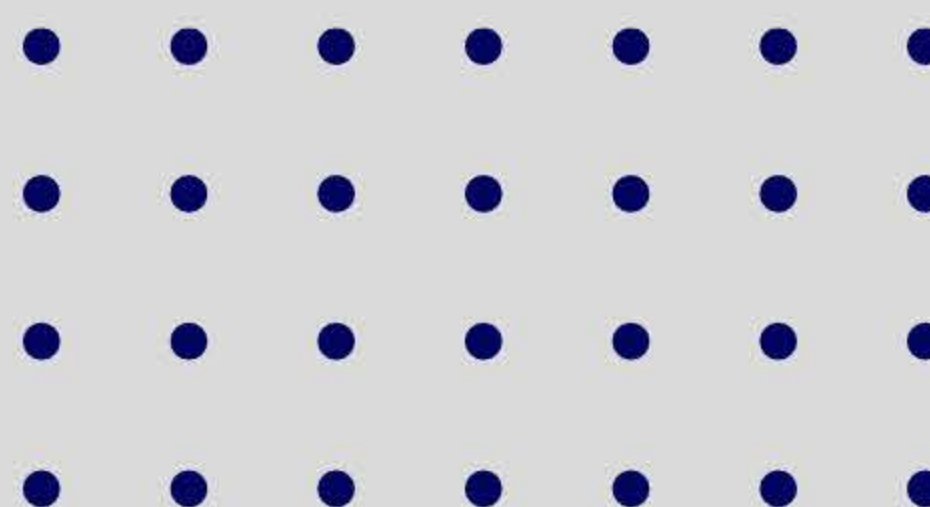

Parvovirus

Parainfluenza

Bordetella

Protects against one strain of Bordetella, aka kennel cough, an airborne upper respiratory infection dogs can contract in boarding situations. Most groomers, doggy day care, boarding facilities and puppy classes require this vaccine.

Bordetella is an annual vaccine requiring yearly boosters. Some boarding facilities require Bordetella updated bi-annually (every 6 months)

Vaccine Schedule and information: Canine

12 weeks:

Da2pp booster

Rabies (1 year)

Rabies is not only **required by state law** but it is also a core vaccine. The first dose is valid for one year. Then, it is boosted every 3 years.

Leptospirosis

Considered a life-style vaccine, Leptospirosis is highly recommended for any dog who is going to spend any period of time outside. Leptospirosis is contracted via infected wild animal urine (deer, squirrels, raccoons, possum, mice, rats). Leptospirosis is a zoonotic disease, meaning it can be spread from animal to human, and causes kidney and liver damage. The Leptospirosis vaccine is given at 12 weeks of age and then is boosted 3-4 weeks after, where it will be valid for one year. Lepto is an annual vaccine, requiring yearly boosters.

Lyme

Also considered a life-style vaccine, Lyme is highly recommended for any dog who is going to spend any period of time outside. Since we live in Connecticut, Lyme disease is prevalent in our area and is spread by the bite of infected Deer Ticks. The Lyme vaccine is given at 12 weeks of age and is boosted 3-4 weeks after, where it will be valid for one year. Lyme is also an annual vaccine, requiring yearly boosters.

Canine Influenza

Canine Influenza is recommended for dogs who will be boarded frequently. Most boarding facilities require the vaccine. There is a potential for groomers, doggy day care, and puppy classes to also require this vaccine, it just depends on the facility. Canine Influenza is given at 12 weeks of age and is boosted 3-4 weeks later, where it will be valid for one year. Canine Influenza is an annual vaccine, requiring yearly boosters.

16 weeks:

Da2pp booster (1 year vaccine)

Leptospirosis booster (Annual vaccine)

Lyme booster (Annual vaccine)

Canine Influenza (Annual vaccine)

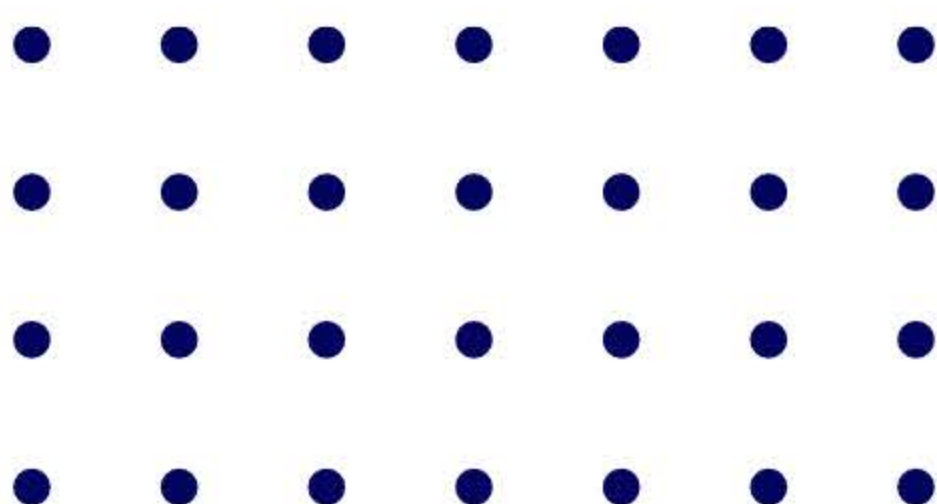

Food/Drinks/Substances That Are TOXIC to Cats and Dogs

IF YOU THINK YOUR PET HAS BEEN POISONED..

Contact your veterinarian or the
**ASPCA National Animal Poison
Control Center** right away at 1-888-
